The exhaust manifold and turbo charger must not be lagged, only the exhaust pipe silencer. For the best forced ventilation system it is usual to use electric motor driven fans. One fan pushing the air into the room and being mounted in the wall opposite the generator end of the set.

Consider insulating pipes. Up to a liter of water vapor can be produced from burning a liter of fuel in diesel engines. Insulation helps retain exhaust in gaseous state and lessens heat radiating into the gen set room. Install long horizontal exhaust pipe runs with a slight downward pitch away from the engine.

Fig. 1, on page 60, shows important details of a typical diesel engine-generator installation. Generally, it's best to locate the engine-driven generator in a room designed for the purpose. The genset should be installed close to the normal electric service, but in a location where it's warm enough so that the genset will start easily.

Best Installation Practices for Exhaust Systems

Engine Exhaust System: The engine exhaust system uses tubing or duct work to guide waste exhaust gases away from a controlled combustion inside an engine. From the engine to the silencer, the tube is referred to as exhaust pipe; from the silencer to the outlet, the tube is referred to as the tailpipe.
